

ADE INSTALLATION PACKAGE

We have slightly changed the way that we deliver ADE versions and updates. In the past new major versions were delivered via a full installer and updates with a online patch. The online patch system meant that each time there was a new major version there was a new installer. Users of older versions were not told of updates and the online checking for patches was intrusive and sometimes inconvenient. The patches used third party code that we no longer wanted to be reliant on.

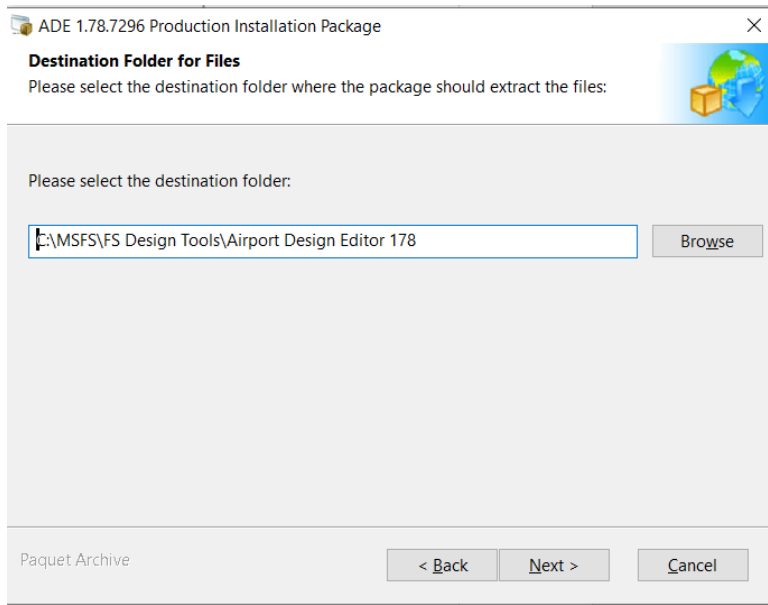

We are now delivering a single installation package which can be used to install a separate new version or update an existing one. This also means that in the future we will be able to offer an update to users with older versions saving the effort of transferring settings and data from one version to another

The installer is delivered as an executable in a zip file which contains these notes and release information. This installer does not make any entries in the registry and does not have, or require, an uninstaller.

Whether you create a new installation or update an existing one depends only on where you set the destination folder. Run the executable

Click Next

FULL If you are making a new clean installation then enter the folder for the installation in the destination folder box. Be sure that this is not the path to an existing installation. You can enter a path that does not already exist and the installer will create it.

UPDATE If you wish to update an existing version (1.75 or later) then use the Browse button to find the main installation folder for the version you wish to update. Be sure that it is the main installation folder for the version you wish to update.

Clicking Next will start off the installation. When it is done you will get this closing dialog
